

Why Bonsai Chose AgMix

The Difference Between Good Rooms and Repeatable Rooms

As cannabis matures, cultivation is becoming less about intuition and more about process control.

The operators separating themselves from the pack are the ones building systems capable of delivering repeatable outcomes at scale. Nutrition, pH, water delivery, temperature, air, and light all interact downstream to affect crop consistency, labor efficiency, extraction performance, and ultimately profitability.

As facilities grow, small inconsistencies become expensive ones. That is why sophisticated operators are increasingly moving toward automation and sensor-driven infrastructure.

That is why Bonsai Cultivation chose DAGDA™ AgMix.

AgMix automates nutrient batching, pH adjustment, and EC monitoring to help cultivation teams tighten irrigation control, reduce variability, minimize waste, and operate more efficiently across large-scale facilities.

At Bonsai's Denver facility, AgMix helped

streamline irrigation workflows across a 25,000 sq ft canopy while improving consistency and reducing manual labor demands.

"The system is running perfectly."

All quotes Tom Stevenson,
Partner, Bonsai Cultivation

**LESS STRESS.
BETTER BATCHES.
MORE CONTROL.**

System Accuracy and Control

- Industrial-grade sensors replaced hand held probes
- pH and EC levels now stable and repeatable
- Recipe variation and calibration drift eliminated
- Fewer room entries/exits during watering, saving additional staff time

"We didn't fully trust our Dosatron and Blue lab calculations."

Labor Efficiency

- Reduced manual mixing and irrigation worklo
- Automated batching streamlined daily wateri operations
- Fewer labor hours spent on prep, adjustment, and monitoring
- More staff time available for cultivation and quality control

Annual Labor Cost Savings more than pay for the equipment

"We gained hours back from the staff going in and out of the rooms prepping to water and post water routines."

Water and Nutrient Waste

- Reduce nutrient and water waste
- Improve irrigation consistency and media saturation
- Lower runoff through tighter batching control
- Cleaner rooms and fewer manual headaches
- Better operational and tour readiness

*"It's a total game changer.
We're more efficient than ever
and thrilled with the results."*
